

## **DATA SUMMARY FOR THE SOUTHERN AND WESTERN TUNA AND BILLFISH (SWTBF)**

**A summary of logbook catch and effort information for the SWTBF  
fishery over the period 1986-2003**

**Jason Hartog, Natalie Dowling and Marinelle Basson**

CSIRO Marine Research, Castray Esplanade  
Hobart 7000, Tasmania  
Australia

This document provides a tabular and graphical summary of logbook catch and effort information for the Southern and Western Tuna and Billfish fishery over the period 1986-2003.

Species abbreviations:

YFT = yellowfin tuna

BET = bigeye tuna

SWO = broadbill swordfish

STM = striped marlin

ALB = albacore

## MAIN FEATURES OF THE DATA

- There has been a large (of an order of magnitude) increase in the number of sets, hooks and vessels, and in the average annual effort per vessel since 1997, but this has stabilised and slightly decreased since 2001 (Tables 1 and 2; Figures 1-4)
- The majority of trips involve one set per day (Table 2; Figure 5). In the last 5 years, the average number of hooks per set has increased from ~1000 to ~1300 (Figure 5; Figure 6).
- The fleet has shown spatial expansion over time in terms of the number of one-degree squares fished, particularly since 1998 (Table 3; Figure 7). In more recent years fishing has extended progressively offshore (Figure 8).
- The number of one-degree squares in which the target species are caught has reflected the spatial expansion of the fleet, with the exception of albacore. This species is only caught in a few (generally <20) one degree squares (Figure 7).
- Catches, particularly of yellowfin and bigeye tuna and broadbill swordfish, have increased since 1997, reflecting the increase in effort. Total catches have stabilised and slightly decreased since 2001. Catch of striped marlin has decreased markedly since 1999 (Table 4; Figures 9-10).
- The annual average weight of retained fish peaked in 1992 for all of the target species with the exception of albacore. Average weights have generally remained stable since 1997, with bigeye tuna average weight increasing since 2000 (NB no weights were recorded for the 4 striped marlin caught in 2001) (Table 5; Figure 11).
- In the last 5 years, the majority of effort has been distributed between 20°S and 36°S (Figure 12). Swordfish, bigeye tuna and albacore catches showed similar latitudinal distributions. In 1999 and 2001, the majority of swordfish and bigeye tuna were caught south of 30°S, but in 2003 swordfish and bigeye tuna catches were more evenly distributed south of 26°S. Albacore were mainly caught at the southernmost latitudes in 2001, but in 1999 and 2003 the latitudinal mode was between 27°S and 29°S. Striped marlin and yellowfin tuna catches had similar latitudinal distributions, with modes at about 21°S and 28°S in recent years.
- Temporal patterns of nominal catch-per-unit-effort (CPUE) varied for each species (Table 5; Figure 13). Broadbill swordfish CPUE consistently increased since 1988. This increase became more rapid since 1997, with swordfish CPUE increasing from less than 150 kg per 1000 hooks to a peak of ~ 350 kg per 1000 hooks in 2001. Bigeye tuna CPUE decreased markedly from 1986 to 1988, after which time it has stabilised at about 100 kg per 1000 hooks. Yellowfin tuna CPUE has shown large inter-annual variability but peaked in 1997 at ~460kg per 1000 hooks. Striped marlin CPUE has not exceeded 25kg per 1000 hooks except in 1989 (63kg per 1000 hooks). Albacore CPUE

peaked at ~240kg in 1991 before declining to less than 40kg per 1000 hooks since 1995.

- Swordfish catch rates showed evidence of decrease inshore, but increased in newly exploited offshore areas over the last 6 years (Figures 14-15). Conversely, bigeye tuna, while caught further offshore in recent years, showed higher catch rates being maintained inshore. This suggests that the progressive offshore expansion of the fleet may have occurred in response to decreasing swordfish catch rates inshore.

**Table 1:** SWTBF summary of effort. Note that “effort” refers to numbers of hooks

Year	IDS	Names	Days Fished	Sets where Hooks>=50			Sets where Hooks<50		Total Sets	Total Effort	Effort (1000s)
