

# Fundamental Distinction In Experimental Design

---

•IOTC-2008-WPTT-36

## Basic Data to be Collected

# Population Dynamics Model

---

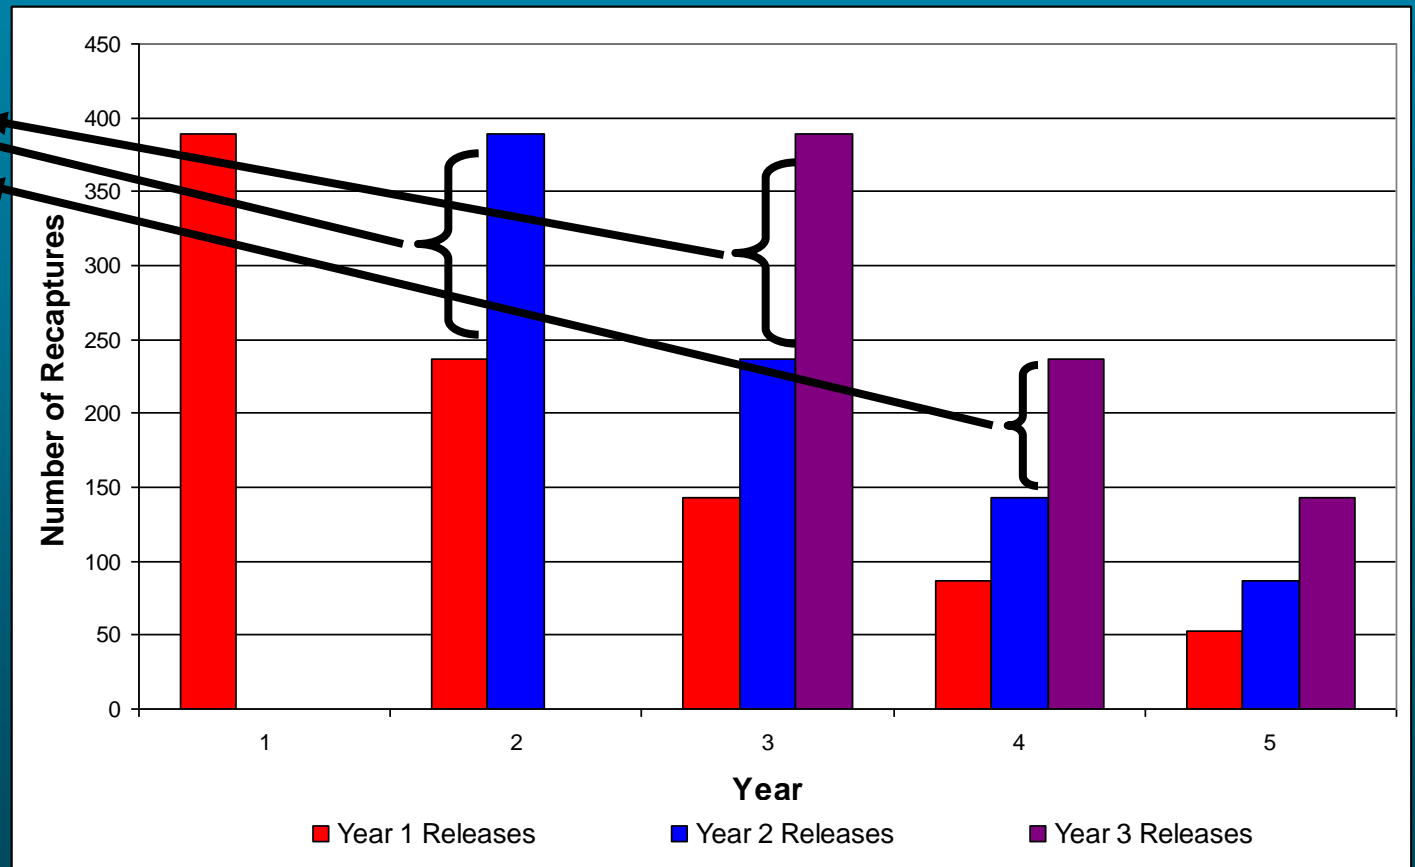

$$N_{i+1,t+1} = N_{i,t} \exp(-F_{i,t} - M_{i,t})$$

$$E R_{i,t} = \frac{F_{i,t}}{F_{i,t} + M_{i,t}} N_{i,t} [1 - \exp(-F_{i,t} - M_{i,t})]$$

Same basic model for overall population and population of tag fish underlies Brownie and tag attrition approach (alternatively can use other formulations for relationship between F and M – e.g. seasonal fishery)

# Brownie Approach

Difference due to  $Z$   
in year  $i$   
(Ratio will remain same  
independent of reporting  
rate)

$F=0.3$   
 $M=0.2$

1600 Releases Each Year for 3 Years

# Brownie Approach

Release Age	Number of releases	Expected number of returns from age class $i$			
		1	2	3	4
1	$N_1$	$N_1 u_1$	$N_1 S_1 u_2$	$N_1 S_1 S_2 u_3$	$N_1 S_1 S_2 S_3 u_4$
2	$N_2$		$N_2 u_2$	$N_2 S_2 u_3$	$N_2 S_2 S_3 u_4$
3	$N_3$			$N_3 u_3$	$N_3 S_3 u_4$

$$S_i = \exp(-F_i - M_i)$$

$$u_i = \frac{F_i}{F_i + M_i} (1 - S_i)$$

# Brownie Approach

Release Age	Number of releases	Expected number of returns from age class $i$			
		1	2	3	4
1	$N_1$	$N_1 u_1$	$N_1 S_1 u_2$	$N_1 S_1 S_2 u_3$	$N_1 S_1 S_2 S_3 u_4$
2	$N_2$		$N_2 u_2$	$N_2 S_2 u_3$	$N_2 S_2 S_3 u_4$
3	$N_3$			$N_3 u_3$	$N_3 S_3 u_4$

$$S_i = \exp(-F_i - M_i)$$

$$u_i = \frac{F_i}{F_i + M_i} (1 - S_i)$$

# Brownie Approach

Release Age	Number of releases	Expected number of returns from age class $i$			
		1	2	3	4
1	$N_1$	$N_1 u_1$	$N_1 S_1 u_2$	$N_1 S_1 S_2 u_3$	$N_1 S_1 S_2 S_3 u_4$
2	$N_2$		$N_2 u_2$	$N_2 S_2 u_3$	$N_2 S_2 S_3 u_4$
3	$N_3$			$N_3 u_3$	$N_3 S_3 u_4$

$$S_i = \exp(-F_i - M_i)$$

$$u_i = \frac{F_i}{F_i + M_i} (1 - S_i)$$

# ITOC TAGGING DATA

---

- releases aggregated by month and estimated age using Alain's growth curve
- For each age/month event predict number of recaptures for each month
- Only used releases for ages 0, 1, 2 and 3
- Only used recaptures through age 4
- Reporting rate for PS returns estimated by assuming 100% for at sea recovery and seeding estimates for those not recaptured at sea.

# ITOC TAGGING DATA

---

- Reporting rate for other fisheries assumed to be zero – i.e. model predicting the number of PS recaptures
- Overall reporting rate estimated by scaling PS reporting rate by proportion of the catch by age in a year caught by PS fishery – yields age and year specific estimates
- No account of tag loss
- Various parameterizations examined for M and F
- Significant best fit was for age specific M for ages 0, 1 and 2+ (but age specific M's are likely to have high CVs)
- Significant best fit was for F separable by age and overall F's levels varying monthly

# ITOC TAGGING DATA

---

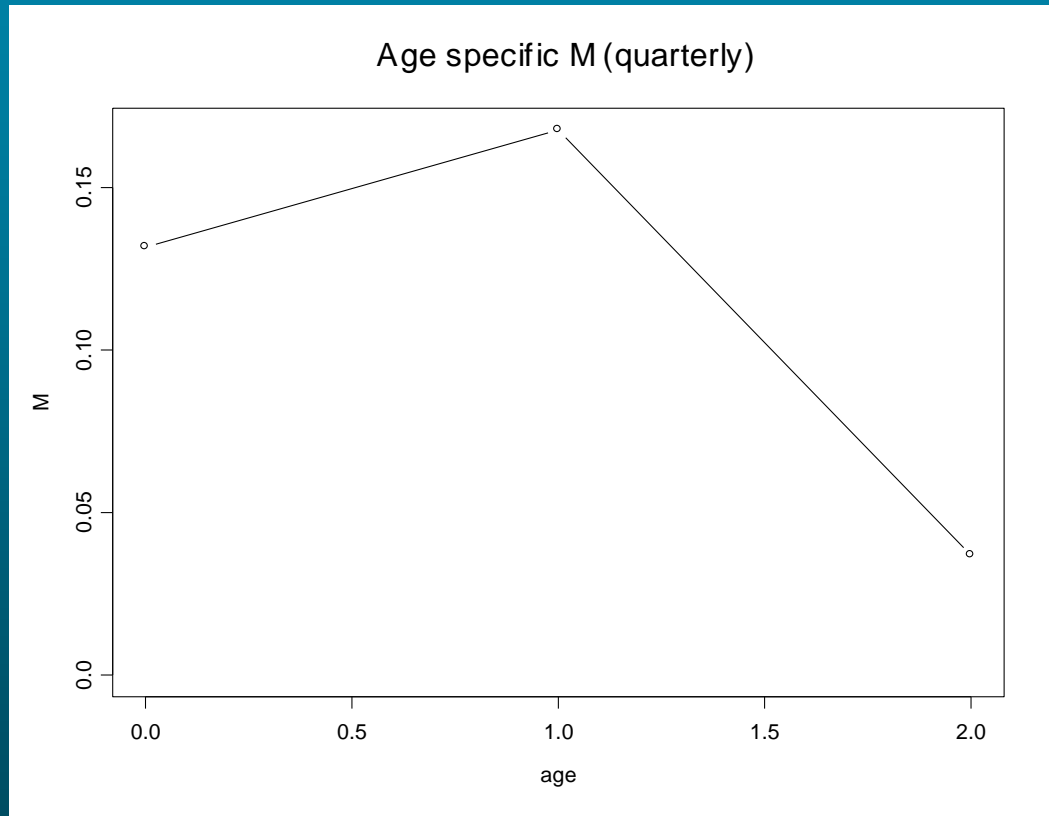

- Reporting rate for other fisheries assumed to be zero – i.e. model predicting the number of PS recaptures
- Overall reporting rate estimated by scaling PS reporting rate by proportion of the catch by age in a year caught by PS fishery – yields age and year specific estimates

	0	1	2	3
